Octal inverting buffers with 3-state outputs

DESCRIPTION

The HEF40240B is an octal inverting buffer with 3-state outputs. It features output stages with high current output capability suitable for driving highly capacitive loads.

The 3-state outputs are controlled by the output enable inputs  $\overline{EO}_A$  and  $\overline{EO}_B$ . A HIGH on  $\overline{EO}$  causes the outputs to assume a high impedance OFF-state. The device also features hysteresis on all inputs to improve noise immunity.

Schmitt-trigger action in the inputs makes the circuit highly tolerant to slower input rise and fall times.

The HEF40240B is pin and functionally compatible with the TTL '240' device.

PINNING

- IA1 to IA4            inputs
- IB1 to IB4            inputs
- OA1 to OA4           bus outputs
- OB1 to OB4           bus outputs
- $\overline{EO}_A, \overline{EO}_B$         output enable inputs (active LOW)
